

Project Orion: Confidential Launch Brief

1. Introduction

Project Orion is the code name for Nexus Corporation's upcoming flagship product: the Quantum-Lite Smartphone. Unlike traditional smartphones, Orion utilizes a localized quantum processing unit (QPU-Micro) designed by Dr. Aris Thorne.

2. Hardware Specifications

- Processor: QPU-Micro v2.4 (Operates at room temperature via magneto-cooling).
- Display: 6.8-inch Holographic OLED with adaptive depth perception.
- Battery: Carbon-lattice energy cell. It provides an estimated 48 hours of continuous heavy usage and recharges to 100% in exactly 8 minutes.
- Weight: 184 grams.

3. Software and AI

The operating system running on Orion is called "NebulaOS". NebulaOS does not use traditional apps; instead, it uses "Intent-Modules". The built-in AI assistant, "Aura", predicts user intentions and dynamically generates UI interfaces on the fly.

4. Launch Details

The official launch date is set for October 14th, 2026. The initial launch will be exclusive to three cities: Tokyo, London, and New York. The retail price is firmly set at \$1,499 USD for the base model, with no planned discounts for the first six months.

5. Security Protocols

Due to the immense processing power of the QPU-Micro, Orion features biometric security that scans the user's pulse and micro-tremors, making spoofing mathematically impossible (Error rate: 1 in 4.7 billion).

6. Environmental Impact

The Carbon-lattice energy cell is 100% biodegradable. Furthermore, Nexus Corporation has pledged that for every Orion device sold, a donation of \$25 will be made to the Ocean Cleanup Initiative.
